                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                          This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portrion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, ocitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour angiogenesis, gastric ulceration,

                                                                                                                                           used to test the specificity of the monoclonal antibody (MAb) of the invention. The MAb of the invention reacts specifically with human TIMP-3 (see AAM30308), by specific recognition of the TIMP-3 fragments represented by AAM30305-W3307. The MAb can be used in the study or diagnosis of TIMP-3-mediated diseases, particularly for the detection of malignant tummour cells, or the diagnosis of progressiveness of cancers. They can also be used in establishing an immunoassay for TIMP-3 or in purification of TIMP-3. The transformed cells can be used for producing TIMP-3 or its equivalent proteins on a large scale. The immunoassay method for TIMP-3 the MAbs is simple, highly reproducible and highly

This invention describes a novel method for the production of antibodies specific for the human tissue inhibitors of metalloproteinase 4, TIMP-4. The anti-TIMP-4 antibodies may be used to treat, prevent or diagnose metastasis of neoplastic cells, angiogenesis and growth tumours such as cervical, uterine, pancreatic, colon or intestinal carcinomas, pregnancy, architis, pulmonary emphysema, peridontal disease, rheumatoid arthitis, corneal or diabetic ulcers or ulcers and lesions caused by microorganisms. This sequence represents TIMP-4 which is used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      metalloproteinase inhibitor; TIMP; metalloproteinase; gelatinase;

Modified TIMP-2 prevents an accumulation of active gelatinase. A on the cell surface, and can inhibit the activation of precursor matrix matelloproteinases. The modified TIMP-2 and the compositions comprising TIMP-2 are useful for inhibiting metastasis of cancer and vascularisation. It is also used for treating diseases associated with them. Specifically, these are useful for preventing or treating metastasis of cancer of the stomach, colon, lung, head and neck, brain tumour, breast, thyroid, prostate, ovary or pancreas, or vascularisation or other conditions associated with these.

                                                                                                                                                                                                                                                                                                                                                          disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the TAPI fusion protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protease inhibitor comprising an alphal-antitrypsin or its functionall active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, otitis excernal or HIV infection, or cystic fibrosis, notitis media, otitis excernal or HIV infection, or constitution an individual suffering from or at risk for a disease or increase in the constitution of the constitution of the inventor activities.
                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel fusion protein with a disorder such inhibitor comprising

This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention of is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, ocitis media, orticis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases used as actopic dermatitis, escema and psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epideration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, pager's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the rTAPPI fusion protein of the invention.

```

The invention relates to full length GENSET human nucleic acids encoding cotentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a converse of the patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid melecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy.

The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and activity. The present sequence is a GENSET polypeptide expression and activity. The Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety or diseases, and for diagnosis of those diseases. Claim 21; Page 825; 921pp; English. of.

                                                The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       08-JUL-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from pig, cattle, rabbit and mouse TIMP-1, human, mouse and cattle TIMP-2 and chicken (Ch) and mouse TIMP-3. A probe based on the ChIMP-3 amino acid sequence (AAR6500) is used to isolate DNA encoding human TIMP-3 from a human cDNA library. Human TIMP-3 can be used for the diagnosis, therapy or prophylaxis of conditions characterized by excess or unwanted matrix metalloproteinase activity, e.g. neoplasias, tumor metastasis, inflammatory disorders such as rheumatoid arthritis, ulcerations, reaction to infection, periodontal disease or osteoporosis. It can

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens and the use of ovarian antigen polynucleotides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and

Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosme mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
New human tissue inhibitor of metallo:proteinase-3 - used to develop prods. for diagnosis, therapy or prophylaxis of conditions with unwanted matrix metallo:proteinase activity.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A.A.C. Session: S66461
A.Molecule type: protein
A.Experimental source: polymorphonuclear leukocytes
C.Comment: This protein, found in a variety of body fluids, complexes with metalloprotein
C.Comment: The remarkable heat stability of this protein may be due to disulfide bond for G.Genetics:
A.Gene: GDB:TIMP1; CLG1; TIMP
A.Cross-references: GBB:119615; OMIM:305370
A.Map position: Xpl1.3-Xpl1.23
C.Superfamily: metalloproteinase inhibitor
C.Keywords: erythropoiesis; glycoprotein; metalloproteinase inhibitor; mitogen
A; Molecule type: protein
A; Residues: 'X', 27-35,'X', 37-52 < VAN>
A; Residues: 'X', 25,'X', 27-35,'X', 37-52 < VAN>
A; Experimental source: monocytic cell line THP-1
A; Note: sequence modified after extraction from NCBI backbone
A; Note: sequence modified after extraction from NCBI backbone
A; Note: sequence incorrectly identified as 96K gelatinase
A; Note: sequence incorrectly identified 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: MRES

A.Map position: X
A.Introns: 41/3; 68/3; 110/3; 152/3
A.Introns: 41/4P-1 and TIMP-1 and TIMP-1 and TIMP-2 possess erythroid potentiation as A.Intron and TIMP-3 have distinct but overlapping tissue-specific expression patt C.Superfamily: metalloproteanase inhibitor
C.Keywords: erythropoiesis; extracellular matrix; glycoprotein; metalloproteinase inhibitor
F):25-205/Product: metalloproteinase inhibitor 1 #status predicted <MAT>-
F):25-94,27-123,37-148,151-197,156-161,169-189/Disulfide bonds: #status predicted
F):54,102/Binding site: carbohydrate (Asn) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Metalloproteinase inhibitor 1 precursor - rat

Mylternate names: TIMP-1

C.Species: Rattus norvegius. (Norway rat)

C.Species: Rattus norvegius.

R.A.Cacession: 302.57; Mylto: 301.64

A.Title: Cloning of the cDNA encoding rat tissue inhibitor of metalloproteinase 1 (TIMI A.Reference number: JC2557; MUID: 95011636; PMID: 7926820

A.Status: preliminary

A.M.Cacession: JA.A.; Shiverick, K.T.; Ogilvie, S.; Buhi, W.C.; Raizada, M.K.

NyAlternate names: TIMP-2; tissue inhibitor of metalloproteinases 2
C;Species: Rattus norvegicus (Norway rat)
C;Date: 10.5ep-1999 #sequence revision 10-Sep-1999 #text_change 10-Sep-1999.
C;Accession: $45683; $20325; $60160
C;Accession: $45683; $20325; $60160

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
